If Finland were your home instead of Netherlands you would...

be **17.57% more** likely to be unemployed

[more info](#) ▼

use **2.3 times more** electricity ▼

have **17.17% less** free time ▼

be **2.4 times more** likely to be murdered ▼

make **17.09% less** money ▼

consume **34.95% less** oil ▼

be **26.67% less** likely to be in prison ▼

spend **26.23% less** money on health care ▼

experience **13.27% less** of a class divide ▼

die **1.43 years** sooner ▼

be **8.2% less** likely to die in infancy ▼

be **50% less** likely to have HIV/AIDS ▼

have **4.43% fewer** babies ▼

Goals and take home message

- Antimicrobial stewardship in the diabetic foot
 - Only treat infected wounds
 - Apply proper culture techniques
 - Only treat the pathogen
 - Use oral antibiotics when possible
 - Do not overuse antibiotics
 - Do not overuse antiseptics

Antibiotic stewardship principles

- Use guidelines for antibiotic treatment
 - Make local antibiotic guidelines, based on national guidelines
- Take cultures before starting treatment
- Switch from empiric antibiotics to pathogen-directed therapy as soon as possible
- Switch from iv to oral therapy within 48-72 hours
- Consider the use of inflammatory biomarkers to decide continuation of therapy

Antibiotic Targets

Antibiotic Resistance

Antiseptic and antibiotic resistance

- Links between chlorohexidine tolerance and antibiotic resistance
 - Colistin¹
 - Vancomycin²
- FDA bans antiseptic use in soap³
 - Not effective in preventing infection
 - Possible harm through antibacterial resistance

Resistance is ancient

Stratigraphic profile and location of Bear Creek site

Peters

Elevation is given in metres above base of exposure. Permafrost samples from below Dawson tephra were dated to about 30 kyr bp. Preservation of the ice below and above the sample indicates that the sediments have not thawed since deposition. Silhouettes represent mammals and birds identified from ancient DNA sequences that are typical of the regional Late Pleistocene environment. aDNA, ancient DNA

30,000 deaths per year by MDR organisms in Europe

Attributable deaths and disability-adjusted life-years caused by infections with antibiotic-resistant bacteria in the EU and the European Economic Area in 2015: a population-level modelling analysis

*Alessandro Cassini, Liselotte Diaz Högberg, Diamantis Plachouras, Annalisa Quattrocchi, Ana Hoxha, Gunnar Skov Simonsen, Mélanie Colomb-Cotinat, Mirjam E Kretzschmar, Brecht Devleesschauwer, Michele Cecchini, Driss Ait Ouakrim, Tiago Cravo Oliveira, Marc J Struelens, Carl Suetens, Dominique L Monnet, and the Burden of AMR Collaborative Group**

Summary

Background Infections due to antibiotic-resistant bacteria are threatening modern health care. However, estimating their incidence, complications, and attributable mortality is challenging. We aimed to estimate the burden of infections caused by antibiotic-resistant bacteria of public health concern in countries of the EU and European Economic Area (EEA) in 2015, measured in number of cases, attributable deaths, and disability-adjusted life-years (DALYs).

Systematic review diabetic foot infection

- 13,365 titles reviewed
- 40 studies identified
- 15 studies to systemic antibiotics
 - 11 in osteomyelitis

Systematic review diabetic foot infection

- Globally no differences in outcome among antibiotic regimens/route of administration
- Used duration of antibiotics
 - Skin soft tissue infection (SSTI) 6-28 days
 - SSTI and osteomyelitis 6-28 days
- Clinical cure rates
 - SSTI 48-90%
 - SSTI and osteomyelitis 61-94%

1 Table 9. Suggested empirical antibiotic regimens, based on clinical severity, for diabetic foot infections.

Route and agent(s)	Mild	Moderate/ Severe	Comments
	Oral for most	Oral or Parenteral ^{\$}	
Dicloxacillin	Yes		Requires QID dosing; inexpensive
Clindamycin*	Yes		Usually active against community-associated MRSA, but check macrolide sensitivity and consider ordering a "D-test" before using for MRSA. A protein synthesis inhibitor against some bacterial toxins
Cephalexin*	Yes		Requires QID dosing; inexpensive
Trimethoprim-sulfamethoxazole	Yes		Active against community-associated MRSA; uncertain activity against streptococci
Amoxicillin/ clavulanate*	Yes		Relatively broad-spectrum oral agent (including anaerobes)
Levofloxacin*	Yes	Yes	Once daily dosing; suboptimal <i>S. aureus</i> activity
Cefoxitin*	---	Yes	Cephalosporin that covers most anaerobes
Ceftriaxone	---	Yes	Once daily dosing
Ampicillin/ sulbactam *	---	Yes	Adequate if low suspicion of <i>Pseudomonas aeruginosa</i>
Linezolid ^a	---	Yes	Expensive; increased risk of toxicities when used > 2 weeks Only FDA approved oral agent for cSSSI caused by MRSA
Daptomycin* ^a	---	Yes	Once daily dosing. Requires serial monitoring of creatinine kinase
Vancomycin ^{a*}		Yes	Vancomycin MIC "creep" for MRSA may be of concern
Moxifloxacin*	---	Yes	Once daily oral dosing. Relatively broad-spectrum, including most obligate anaerobes
Ertapenem*		Yes	Once daily dosing. Relatively broad-spectrum (including anaerobes) but not active against <i>Pseudomonas aeruginosa</i>
Tigecycline*	---	Yes	Active against MRSA. Spectrum may be excessively broad. High rates of nausea and vomiting, increased mortality warning. Non-equivalent to ertapenem +/- vancomycin in 1 RCT
Piperacillin/ tazobactam*	---	Yes	TID/QID dosing—may need infusion pump for out-of-hospital use. Useful for broad-spectrum coverage, including <i>Pseudomonas aeruginosa</i> , when appropriate
Levofloxacin or ciprofloxacin with clindamycin*	---	Yes	Limited evidence supporting clindamycin for severe <i>S. aureus</i> infections; PO and IV formulations available for all 3 agents
Imipenem-cilastatin *	---	Yes	Broad-spectrum coverage; use only when this is required Consider when suspect ESBL-producing organism.

Lipsky, CID,
IDSA guideline
2012

Do not treat clinically uninfected wounds

- Uninfected diabetic foot ulcers
 - Amoxicillin/clavulanate and ceftriaxone not effective ^{1,2}
- Uninfected venous leg ulcers
 - Antibiotics not useful for heavily contaminated, clinically uninfected ulcers ³

Association with outcome??

Van Asten, *Int Wound J*, 2015

Antibiotics: how and how long?

Table 4. IDSA recommendations for antibiotic route and duration [9].

Site, by severity or extent, of infection	Route of administration	Duration of therapy
<i>Soft-tissue only</i>		
Mild		1 – 2 weeks; may extend up to 4 weeks if slow to resolve
Moderate	Oral (or initial parenteral)	2 – 4 weeks
Severe	Initial parenteral, switch to oral when possible	2 – 4 weeks
<i>Bone or joint</i>		
No residual infected tissue (e.g., post-amputation)	Parenteral or oral	2 – 5 days
Residual infected soft tissue, but not bone	Parenteral or oral	2 – 4 weeks
Residual infected but viable bone	Initial parenteral, then consider oral switch	4 – 6 weeks
No surgery, or residual dead bone postoperatively	Initial parenteral, then consider oral switch	> 3 months

Wound swabs

- Easier to perform
- Non-invasive
- Identifying anaerobes (and gram-negatives)??

Tissue samples

- More time-consuming
- Risk of injury to surrounding tissues
- Safe in large cohorts
- More accurate microbiological diagnosis of DFI

Table 3. Proportion of pathogens isolated from cultures of bone biopsy and/or swab samples obtained from 69 patients with diabetes with suspected foot osteomyelitis.

Pathogen	No. of instances in which culture yielded the specified pathogen				Concordance, ^a %
	Total	From bone biopsy sample only	From swab sample only	From both bone biopsy and swab samples	
<i>Staphylococcus aureus</i>	49	13	15	21	42.8
CNS	35	30	4	1	2.8
Streptococci ^b	31	11	12	8	25.8
Enterococci	15	9	5	1	6.67
Corynebacteria	10	2	8	0	0
Gram-negative bacilli	42	12	18	12	28.5
Anaerobes	9	6	3	0	0
Total	191	79	65	43	22.5

Outcome of diabetic foot osteomyelitis

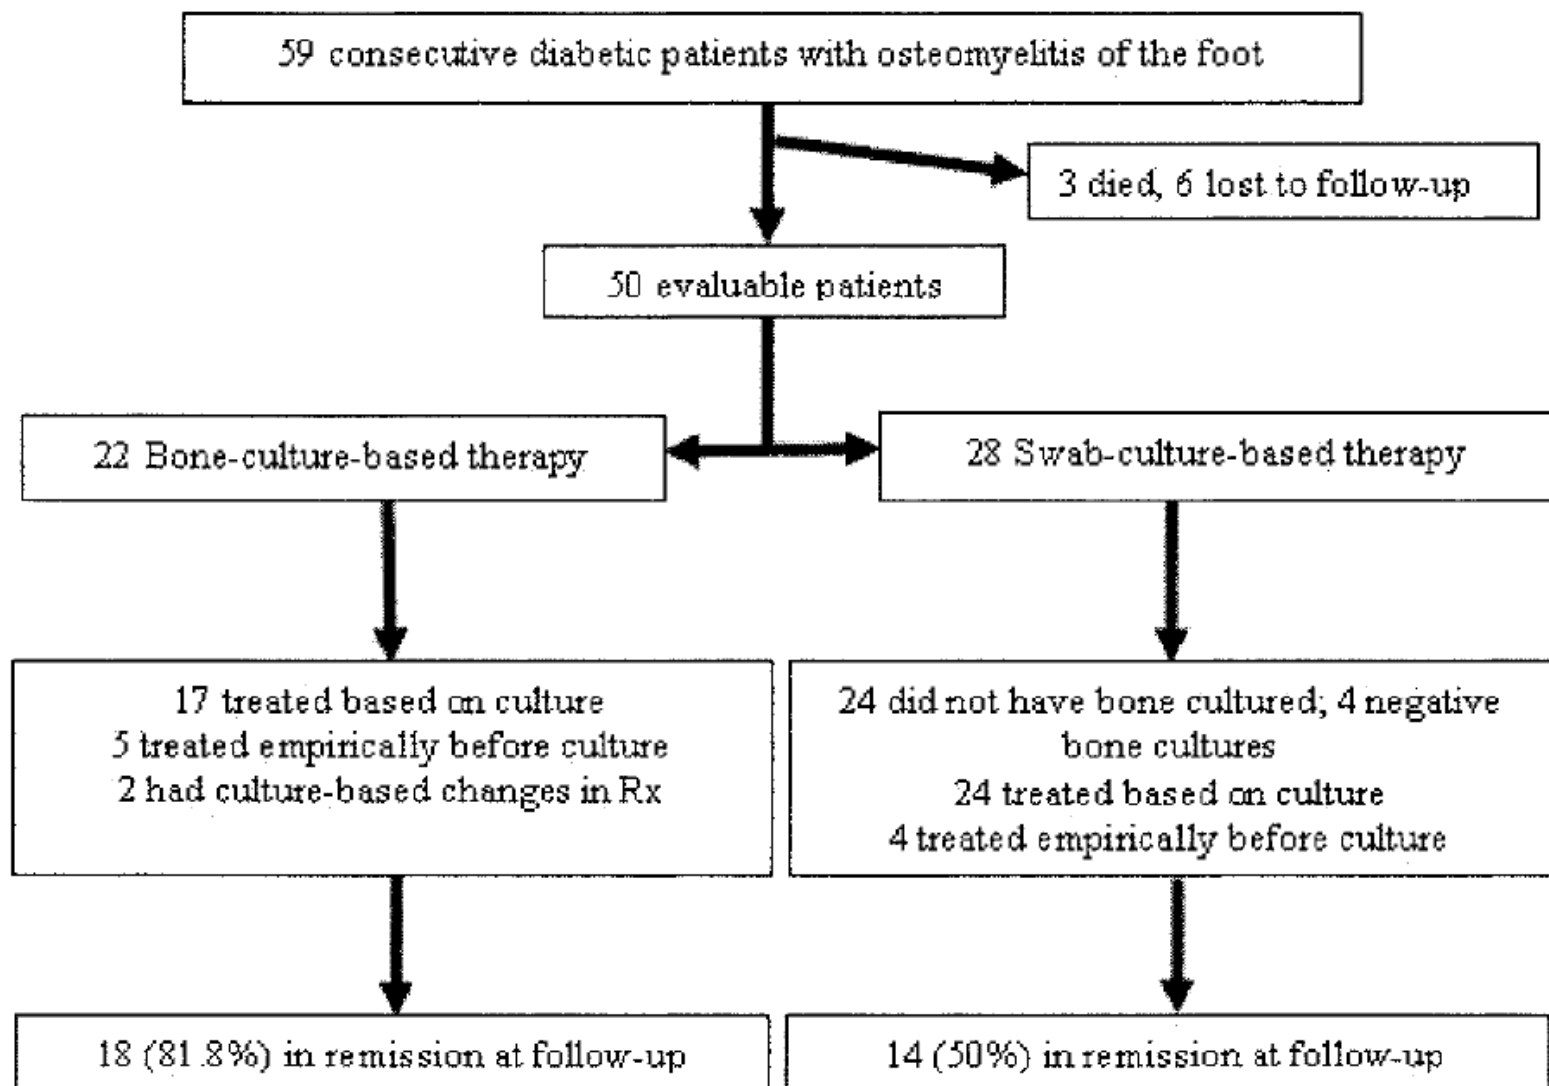

Figure 1—Summarized data for patients' outcome.

Treatment: myths

Do not:

- Treat uninfected ulcers to promote healing
- Treat infected ulcers until the ulcer is healed
- Treat all the organisms isolated from the microbiological specimens
- Hospitalise all infections
- Give lots of intravenous therapy

Take home message

- Antimicrobial stewardship in the diabetic foot
 - Only treat infected wounds
 - Apply proper culture techniques
 - Only treat the pathogen
 - Use oral antibiotics when possible
 - Do not overuse antibiotics
 - Do not overuse antiseptics
